

# Poverty & Access To Water

The y-axis represents the percent of each country's population that does not have access to an improved water source

-The x-axis represents the percent of each country's population that lives on \$2.00 or less each day

-An improved water source is defined as access to a deep well, filtration system, piped water, or rain barrels. The poverty data was found using Purchasing Power Parity (PPP), which is an economic technique that estimates what the exchange rate would have to be in order for two currencies to be equal value.
